

Overview of the module

- Day 1 Concept of algorithm, Cryptography, recursion, Knapsack, Shortest Path
- Day 2 Complexity, Graph problems, Theory

Organisation

- ► The exercices will be in python
- Please clone the following repository :
 https://github.com/nlehir/ALGO1.git
- ► Third party libs : matplotlib, numpy, pygraphviz, graphviz.
- Optional but useful: ipdb (python debug) or another debugger

Day 2

The problem of complexity

Time and space complexities Measuring time complexities Profiling Computing complexities Space complexity

Famous graph problems

Random graphs
Dominating set
Coloring
Independent Set

Theoretical problems

➤ Today we will **quantify** the **complexity** of several problems : how many operations are required to answer a given question, as a function of the size of the input ? Is it possible to **compute** an answer with a computer ?

- ► Today we will **quantify** the **complexity** of several problems : how many operations are required to answer a given question, as a function of the size of the input ? Is it possible to **compute** an answer with a computer ?
- Importantly, this is called the time complexity of the problem. It does not take the memory usage into account.

- ► Today we will **quantify** the **complexity** of several problems : how many operations are required to answer a given question, as a function of the size of the input ? Is it possible to **compute** an answer with a computer ?
- Importantly, this is called the time complexity of the problem. It does not take the memory usage into account.
- ► However, we will also discuss **space complexity** that, quantifies memory usage.

► The answer is that **it depends on the problem**. For some problems, it is very probable that there exists **no exact fast** solution (for instance the NP-hard problems)

Measuring complexities

► Let us measure the time complexity of some simple programs. How ?

Measuring complexities

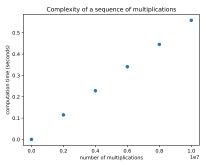

- ► Let us start by measuring the complexity of some simple programs.
- ▶ We can first measure the computing time.

Exercice 1 : Linear complexity

cd complexity and use linear_complexity.py to verify that the complexity of a sequence of multiplications is proportionnal to its length.

Exercice 1: Linear complexity

- cd complexity and use linear_complexity.py to verify that the complexity of a sequence of multiplications is proportionnal to its length.
- It should look like this :

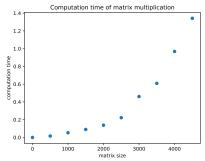

Exercice 2 : Non linear complexity

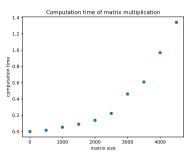

► What happens with matrix multiplication ? modify matrix_multiplication.py to estimate the computing time as a function of the size of the matrix.

Exercice 2: Non linear complexity

- What happens with matrix multiplication? modify matrix_multiplication.py to estimate the computing time as a function of the size of the matrix.
- It should look like this :

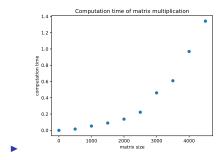

Matrix multiplication

Let's give a rough approximation of the number of operations as a function of the size *n* of the matrix.

Matrix multiplication

- ► Let's give a rough approximation of the number of operations as a function of the size *n* of the matrix.
- ▶ It should then bo of order $\mathcal{O}(n^3)$. However, some **sub-cubic** algorithms exists : faster than n^3

Measuring the time?

▶ Why is **time** maybe not the best tool to evaluate the complexity of an algorithm ?

Measuring the time?

- Why is time maybe not the best tool to evaluate the complexity of an algorithm ?
- ▶ It depends on the machine

Measuring the time?

- Why is time maybe not the best tool to evaluate the complexity of an algorithm ?
- ▶ It depends on the machine
- ▶ We could count the number of elementary operations instead.

Experimental evaluation

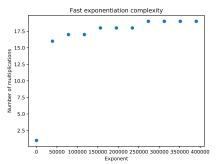

Exercice 3 : Counting the number of elementary operations

▶ Please use a variable in **exponentiation_complexity.py** to compute the number of operations in fast exponentiation and normal exponentiation.

Experimental evaluation

Exercice 3: Counting the number of elementary operations

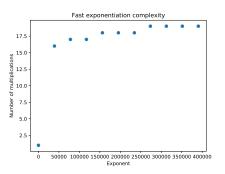

- Please use a variable in exponentiation_complexity.py to compute the number of operations in fast exponentiation and normal exponentiation.
- It should look like :

Experimental evaluation

Exercice 4: Counting the number of elementary operations

▶ We note the **logarithmic complexity** $\mathcal{O}(\log n)$

Asymptotic behavior

▶ What matters is the **asymptotic** behavior, when $n \to \infty$

Asymptotic behavior

- ▶ What matters is the **asymptotic** behavior, when $n \to \infty$
- ► This tells if the algorithm **scales** (still works when the instance of the problem is larger)

Asymtptic behavior : \mathcal{O} notation

- ▶ Mathematically speaking, we say that $f = \mathcal{O}(g)$ if the ratio $\frac{|f|}{|g|}$ is **bounded**
- ▶ || means "absolute value"
- ▶ intuitively, this means that f is not bigger than g

Asymptotic behavior : examples

$$n^2 + n = \mathcal{O}(n^2) \tag{1}$$

$$5 \times n^4 + 2178 \times n^3 + \log 3n = \mathcal{O}(?)$$
 (2)

- Fast exponentiation
- Naive exponentiation
- Merge sort
- Insertion sort
- Matrix multiplication
- Enumeration of subsets, TSP, coloring
- ► Enumeration of permutations

- ▶ Fast exponentiation $\mathcal{O}(\log n)$
- Naive exponentiation
- Merge sort
- Insertion sort
- Matrix multiplication
- Enumeration of subsets, TSP, coloring
- ► Enumeration of permutations

- ▶ Fast exponentiation $\mathcal{O}(\log n)$
- ▶ Naive exponentiation $\mathcal{O}(n)$
- Merge sort
- Insertion sort
- Matrix multiplication
- Enumeration of subsets, TSP, coloring
- ► Enumeration of permutations

- ▶ Fast exponentiation $\mathcal{O}(\log n)$
- ▶ Naive exponentiation $\mathcal{O}(n)$
- ▶ Merge sort $\mathcal{O}(n \log n)$
- Insertion sort
- Matrix multiplication
- Enumeration of subsets, TSP, coloring
- ► Enumeration of permutations

- ▶ Fast exponentiation $\mathcal{O}(\log n)$
- ▶ Naive exponentiation $\mathcal{O}(n)$
- ▶ Merge sort $\mathcal{O}(n \log n)$
- ▶ Insertion sort $\mathcal{O}(n^2)$
- Matrix multiplication
- Enumeration of subsets, TSP, coloring
- ► Enumeration of permutations

- ▶ Fast exponentiation $\mathcal{O}(\log n)$
- ▶ Naive exponentiation $\mathcal{O}(n)$
- ▶ Merge sort $\mathcal{O}(n \log n)$
- ▶ Insertion sort $\mathcal{O}(n^2)$
- ▶ Matrix multiplication $\mathcal{O}(n^{2.37})$
- Enumeration of subsets, TSP, coloring
- Enumeration of permutations

- ▶ Fast exponentiation $O(\log n)$
- ▶ Naive exponentiation $\mathcal{O}(n)$
- ▶ Merge sort $\mathcal{O}(n \log n)$
- ▶ Insertion sort $\mathcal{O}(n^2)$
- ▶ Matrix multiplication $\mathcal{O}(n^{2.37})$
- ▶ Enumeration of subsets, TSP, coloring $\mathcal{O}(2^n)$
- Enumeration of permutations

- ▶ Fast exponentiation $\mathcal{O}(\log n)$
- ▶ Naive exponentiation $\mathcal{O}(n)$
- ▶ Merge sort $\mathcal{O}(n \log n)$
- ▶ Insertion sort $\mathcal{O}(n^2)$
- ▶ Matrix multiplication $\mathcal{O}(n^{2.37})$
- ▶ Enumeration of subsets, TSP, coloring $\mathcal{O}(2^n)$
- ▶ Enumeration of permutations $\mathcal{O}(n!)$

Orders of magnitude

Orders of magnitude

Taille	n log n	n ³	2 ⁿ
n = 20	60	8000	1048576
n = 50	196	125000	112589990700000
n = 100	461	1000000	12676506000000000000000000000000000000000
Hanso the idea of a border between polynomial and exponential algorithms			

⇒ Hence the idea of a border between polynomial and exponential algorithms.

Profiling

- Another useful tool to monitor the execution of a program is profiling
- ► From the python docs : "A profile is a set of statistics that describes how often and for how long various parts of the program executed"
- https://docs.python.org/3.6/library/profile.html

Profiling

Exercice 4: Profiling a piece of code

cd profiling and profile some programs that we used before

Profiling

Exercice 4: Profiling a piece of code

- cd profiling and profile some programs that we used before
- However note that when profiling profiling_demo.py, the elementary multiplications are not taken into account in the profiling output.

Computing complexities

We now want to compute some complexities with paper and pen. Let us focus on some intuitive rules:

- ► For a sequence of blocks :
- ► For a loop :

Computing complexities

We now want to compute some complexities with paper and pen. Let us focus on some intuitive rules :

- ▶ For a sequence of blocks : complexities sum up
- ► For a loop :

Computing complexities

We now want to compute some complexities with paper and pen. Let us focus on some intuitive rules :

- ► For a sequence of blocks : complexities sum up
- ► For a loop : complexities of all iterations sum up
- If a loop consists in similar iterations, its complexity is the product of the compexity of one iteration by the size of the loop.

Running time

Exercice 5: Computing a running time I TODO

Running times

Exercice 6 : Computing a running time II Please compute the running time of the following algorithm.

Some mathematical concepts

- Mathematical induction
- ▶ Applications : prime factors decomposition, $\sum_{k=1}^{n} k$

Running times

Exercice 7 : Comuting a running time III
Please compute the running time of the following algorithm.

```
from math import log
def dec2bin(n):
    m = int(log(n)/log(2))
    liste = [O for i in range(m+1)]
    for i in range(m+1):
        liste[i] = n%(2**(i+1))//(2**i)
    return liste
def enum_bin(p):
    for n in range(1,p):
        print(dec2bin(n))
```

- Let us consider the case of evaluating polynoms
- ▶ A polynom is a function of the form $f: x \to a_n x^n + a_{n-1} x^{n-1} + ... + a_1 x + a_0$
- How many multiplications are involved with the naive method ?

- Let us consider the case of evaluating polynoms
- ▶ A polynom is a function of the form $f: x \to a_n x^n + a_{n-1} x^{n-1} + ... + a_1 x + a_0$
- How many multiplications are involved with the naive method ?
- ▶ We look fot an algorithm that is faster than the naive solution.

Example of Horner algorithm when

$$P: x \to 7x^4 + 2x^3 - 5x + 1:$$

$$P(x) = (((7x+2)x+0)x-5)x+1$$
 (3)

Example of Horner algorithm when

$$P: x \to 7x^4 + 2x^3 - 5x + 1:$$

$$P(x) = (((7x+2)x+0)x-5)x+1$$
 (4)

How many multiplications are now involved ?

Example of Horner algorithm when

$$P: x \to 7x^4 + 2x^3 - 5x + 1:$$

$$P(a) = (((7a+2)a+0)a-5)a+1$$
 (5)

- ▶ How many multiplications are now involved ? $\mathcal{O}(n)$.
- So we went from quadratic to linear.

Example of Horner algorithm when

$$P: x \to 7x^4 + 2x^3 - 5x + 1:$$

$$P(x) = (((7x+2)x+0)x-5)x+1$$
 (6)

▶ We input the polynom to the algorithm as the list of the coefficients $[a_n, a_{n-1}, \ldots, a_0]$

Evaluating polynoms

Exercice 8: Implementation of Horner Algorithm

Example of Horner algorithm when $P: x \rightarrow 7x^4 + 2x^3 - 5x + 1:$

$$P(x) = (((7x+2)x+0)x-5)x+1$$
 (7)

- ▶ We input the polynom to the algorithm as the list of the coefficients $[a_n, a_{n-1}, \ldots, a_0]$
- Please modify complexity/horner.py so that it performs the horner algorithm.
- ▶ In order to test that our method is correct, we will test it against the method **polyval** from **numpy**.

Horner

▶ What do you see if you write **help(numpy.polyval)** inside python ?

Horner

What do you see if you write help(numpy.polyval) inside python?

```
Horner's scheme [1] is used to evaluate the polynomial. Even so, for polynomials of high degree the values may be inaccurate due to rounding errors. Use carefully.

Figure: Horner is actually the method used by numpy

Space complexty

► TODO

Graph problems

Graph problems

We will look at famous graph problems, typically of the form :

- "what is the largest subset of nodes of the graph, verifying some property?"
- "what is the largest subset of edges of the graph, such that some property is verified?"

Graphviz

We will use graphviz to visualize graphs.

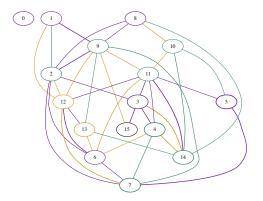

Figure: Undirected random graph generated with python

Warm up question

Given an **unoriented** graph with n nodes, how many edges can we build ?

Notation of a graph : G(V, E)

V : set of n vertices

► *E* : set of edges

Warm up question

Given an **unoriented** graph with n nodes, how many edges can we build ?

Notation of a graph : G(V, E)

- V : set of n vertices
- ▶ E: set of edges, maximum size: $\frac{n(n-1)}{2} = \binom{n}{2} = \frac{n!}{2!(n-2)!}$

Graphviz

In order to do the following exercises, you will need **graphviz**.

Exercice 9: Generating a random graph
Please **cd graphs** and use **random_graph.py** to generate a random graph with 25 nodes and 100 edges

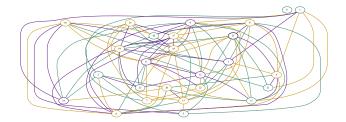

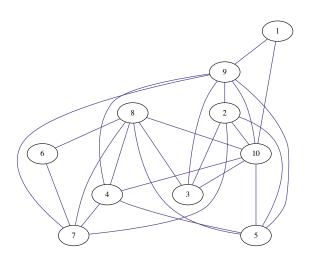

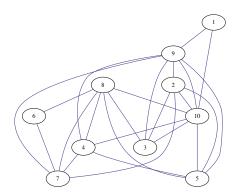

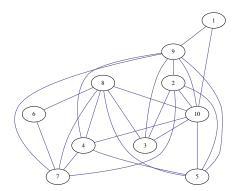

Figure: Random graph with 25 nodes, 100 edges

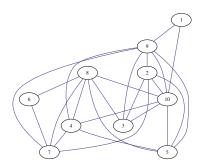

For instance : we want to use the smallest possible number of emitters to cover a network.

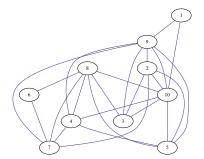

Mathematically speaking: if G(V, E) is the graph. We look for a subset of nodes D such that all nodes in the graph are the neighbor of at least one node in D.

Mathematically speaking: if G(V, E) is the graph. We look for a subset of nodes D such that all nodes in the graph are the neighbor of at least one node in D. And we want to pick the smallest D that works.

What is the most trivial dominant subset?

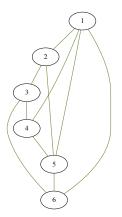

Figure: Some simple graph

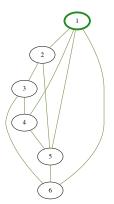

Figure: Is this a dominating subset?

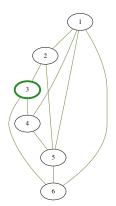

Figure: Is this a dominating subset?

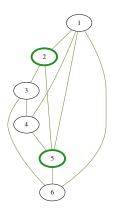

Figure: Is this a dominating subset?

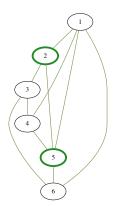

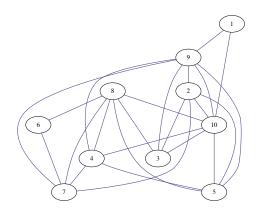

Figure: Is this a dominating subset ? Yes. Is it minimal ?

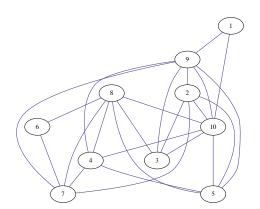

Dominating set: example 2

Please find a dominating set in this graph.

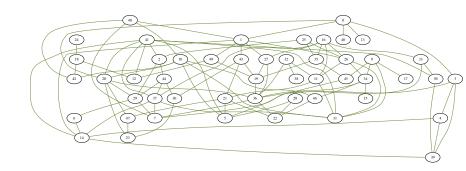

Dominating set: example 2

Please find a minimal dominating set in this graph.

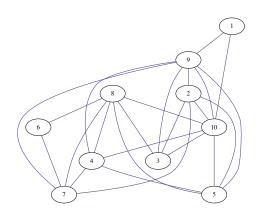

Dominating set: example 2

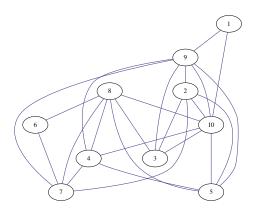

Please find a minimal dominating set in this graph.

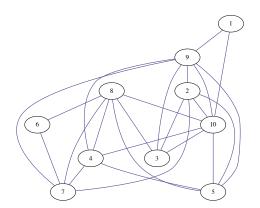

What would be the **exhaustive search** in the case of the Dominating set problem ?

How many possibilities do have to try as a function of n?

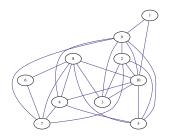

How many possibilities do have to try as a function of n? The number of subsets in [1:n] is :

How many possibilities do have to try as a function of n? The number of subsets in [1:n] is :

$$2^n = \sum_{k=0}^n \binom{n}{k} \tag{8}$$

Heuristic

Ok so the exhaustive search is no possible. So what method should we use ?

Heuristic

Ok so the exhaustive search is no possible. So what method should we use ?

Let's build a greedy algorithm.

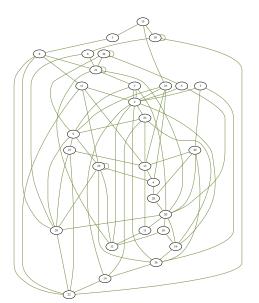

Greedy algorithm

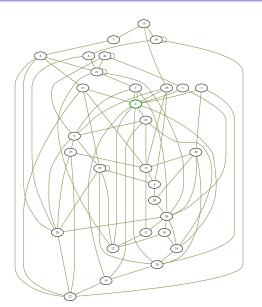

In a graph (unweighted), the **degree of a node** is its number of neighbors.

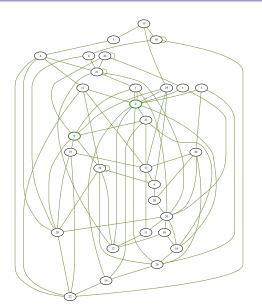

Dominant set

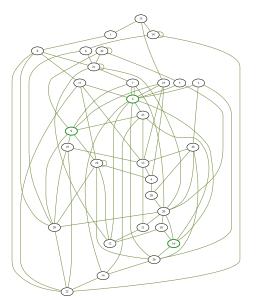

Exercice 10: Greedy algorithm implementation Please modify **dominant_greedy_1** to apply the greedy algorithm:

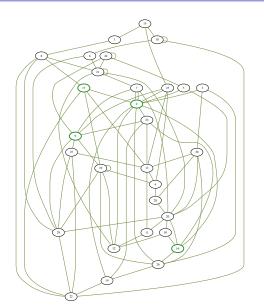

- sort nodes by degree
- progressively add the to the set until it's dominant

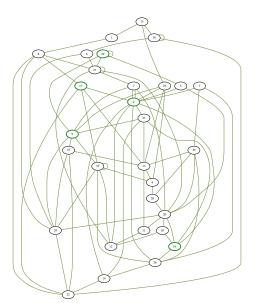

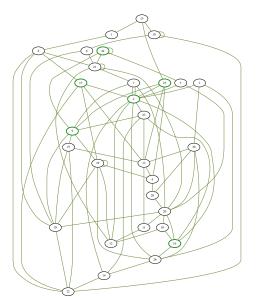

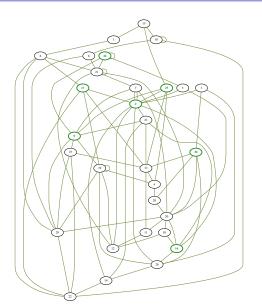

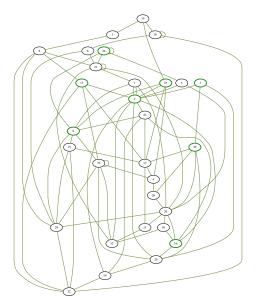

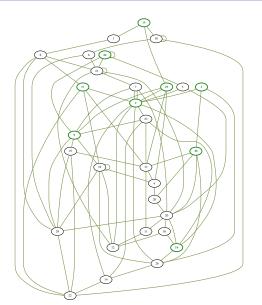

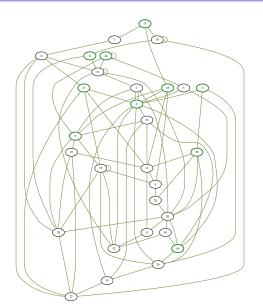

Non optimal greedy algorithm

Let us find an example where the greedy algorithm is clearly not optimal.

Non optimal greedy algorithm

Let us find an example where the greedy algorithm is clearly not optimal.

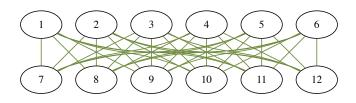

Figure: Complete bipartie graph

The coloring problem

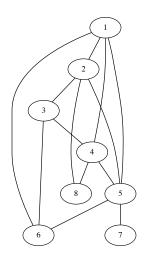

We want to find the smallest number **fully disconnected subgraph** in a graph.

The coloring problem

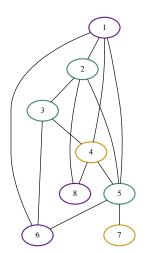

We want to find the smallest number **fully disconnected subgraph** in a graph.

Each subgraph will be associated with a color.

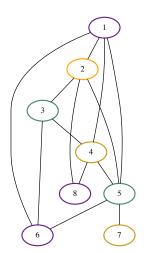

Coloring

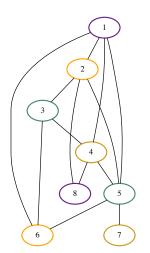

Is this a coloring?

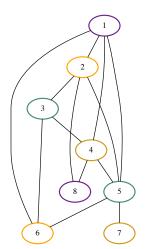

Is this a coloring?

Is this a coloring? yes

Could we have used only 3 colors?

Coloring

▶ What would be a trivial coloring?

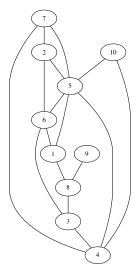

Coloring

- ► What would be a trivial coloring ? assign a color to each node (very bad solution)
- ► Could you think of a heuristic?

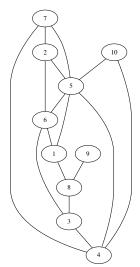

Independent Set

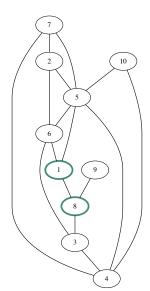

We want to find **the largest disconnected subgraph**. For instance: building the biggest possible team of people that can work together (a edge between them meaning that they can't.)

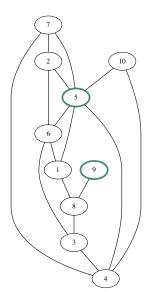

Independent set

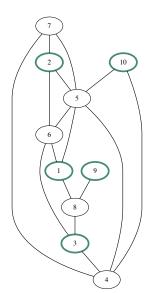

Independent set: what is a trivial independent set?

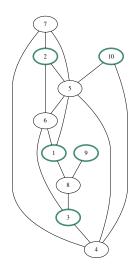

Maximal vs maximum independent set

Complexity

- Running time of an algorithm is its running time on the worst possible input (instance I) it can get (for a given size)
- Complexity of a problem is the running time of the best possible algorithm for that problem.

$$T(P) = \min_{A} \max_{I} T(P, A, I)$$
 (9)

Equivalence between problems

- Some problems have the same difficulty because they are equivalent
- Some are strictly more complex than others
- ► Hard problems : Maximum independent set, minimum coloring, smallest dominating set, TSP, etc.
- ► Easier problem : Shortest Path

Equivalence between problems

Dominating set and maximum clique

Problems that are not equivalent

► Eulerian paths and hamiltonian paths

Classes of complexity

- Problems have been gathered under classes of complexity
- ▶ **P** : we can obtain a solution with polynomial complexity
- ▶ **NP**: we can verify a solution in polynomial time (doesn't mean we can find a solution)
- ▶ **NP hard** : if it is in *P*, all *NP* problems are in *P*.
- ▶ NP complete : NP and NP hard

P=NP?
